CRM – SYSTEM VALIDATION REPORT

Customer Relationship Management System

Project Name	Customer Relationship Management System (CRM)
Testing Period	2 November 2026 – 6 November 2026
Testing Type	System Validation / End-to-End Testing

1. Introduction

System validation testing is performed to verify that the complete CRM application works as expected when its modules, database, authentication, and user interfaces operate together. Testing focuses on end-to-end workflows and role-based access.

2. Objectives

- Validate complete business workflows across the CRM application.
- Verify that frontend actions communicate correctly with backend APIs and MongoDB.
- Check that Admin, Sales Staff, and Support Staff have the appropriate access.
- Verify that created or updated records are reflected in the application and database.
- Identify integration issues and confirm that corrected workflows work as expected.

3. System Environment

Component	**Technology / Configuration**
Frontend	React / TypeScript
Backend	Node.js / Express.js
Database	MongoDB
Authentication	JWT-based authentication
Roles	Admin, Sales Staff, Support Staff

4. End-to-End Validation Scenarios

Test ID	**Scenario**	**Test Procedure**	**Expected Result**
SV01	Application startup	Start backend and frontend; verify that the application loads and backend connects to MongoDB.	Login page loads and API requests can reach the backend.
SV02	Admin authentication	Log in using an active Admin account.	Admin is authenticated and the Admin dashboard is displayed.
SV03	User management	As Admin, create or manage a staff account.	User details are saved and the assigned role is retained.

Test ID	Scenario	Test Procedure	Expected Result
SV04	Sales Staff access	Log in as Sales Staff and open assigned customer records.	Staff member can access permitted records and actions only.
SV05	Support Staff access	Log in as Support Staff and open support-related functions.	Support Staff sees and uses only permitted functionality.
SV06	Customer workflow	Create or update a customer and view the saved record.	Customer information is saved and displayed correctly.
SV07	Lead workflow	Create a lead and update its status.	Lead details and status changes are retained.
SV08	Follow-up and interaction workflow	Add an interaction and schedule a follow-up for a customer.	Both records are associated with the correct customer.
SV09	Sales and loyalty workflow	Create a sale and verify related sales or loyalty information where applicable.	Sales details and related values are updated correctly.
SV10	Deletion approval workflow	Submit a customer deletion request as staff and review it as Admin.	Request status and review details are updated correctly.
SV11	Audit logging	Log in and perform a supported activity; inspect the audit log.	The relevant activity is recorded with user, action, module, and timestamp.
SV12	Reports and dashboard	Open dashboard and report views using available records.	Displayed summaries correspond to the stored application data.

5. Role-Based Access Validation

Role	Expected Access (validate against implementation)	Validation Check
Admin	Manage users and review administrative requests; access permitted CRM administration and reporting functions.	Verify each action against the implemented permissions.
Sales Staff	Access assigned customers and permitted sales-related functions.	Verify that access to unassigned or restricted records is denied.
Support Staff	Access permitted support-related customer functions.	Verify that administrative and restricted sales actions are unavailable or denied.

6. Screenshot Evidence

Insert screenshots captured from the actual running application. Use the suggested evidence points below.

Figure 1 – Application Startup

Show the backend terminal with successful MongoDB connection and the frontend running.

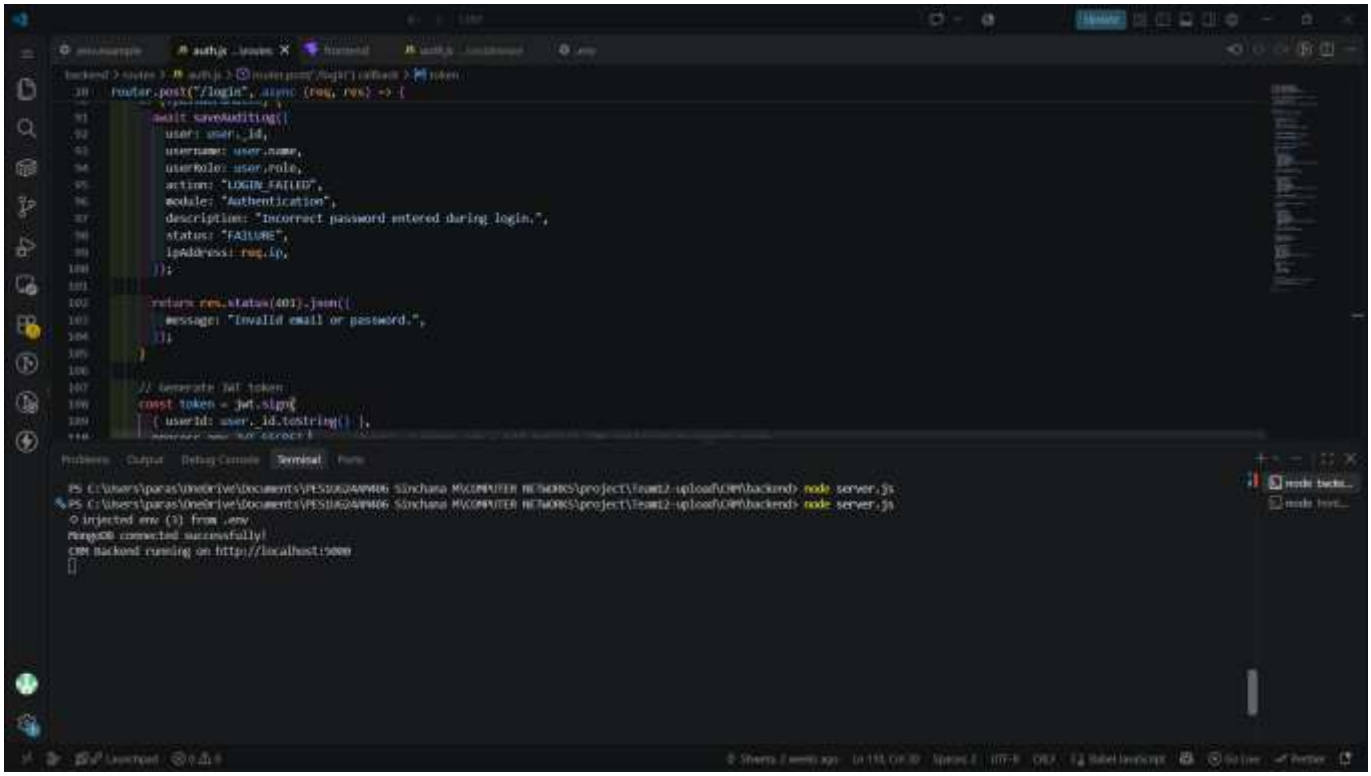

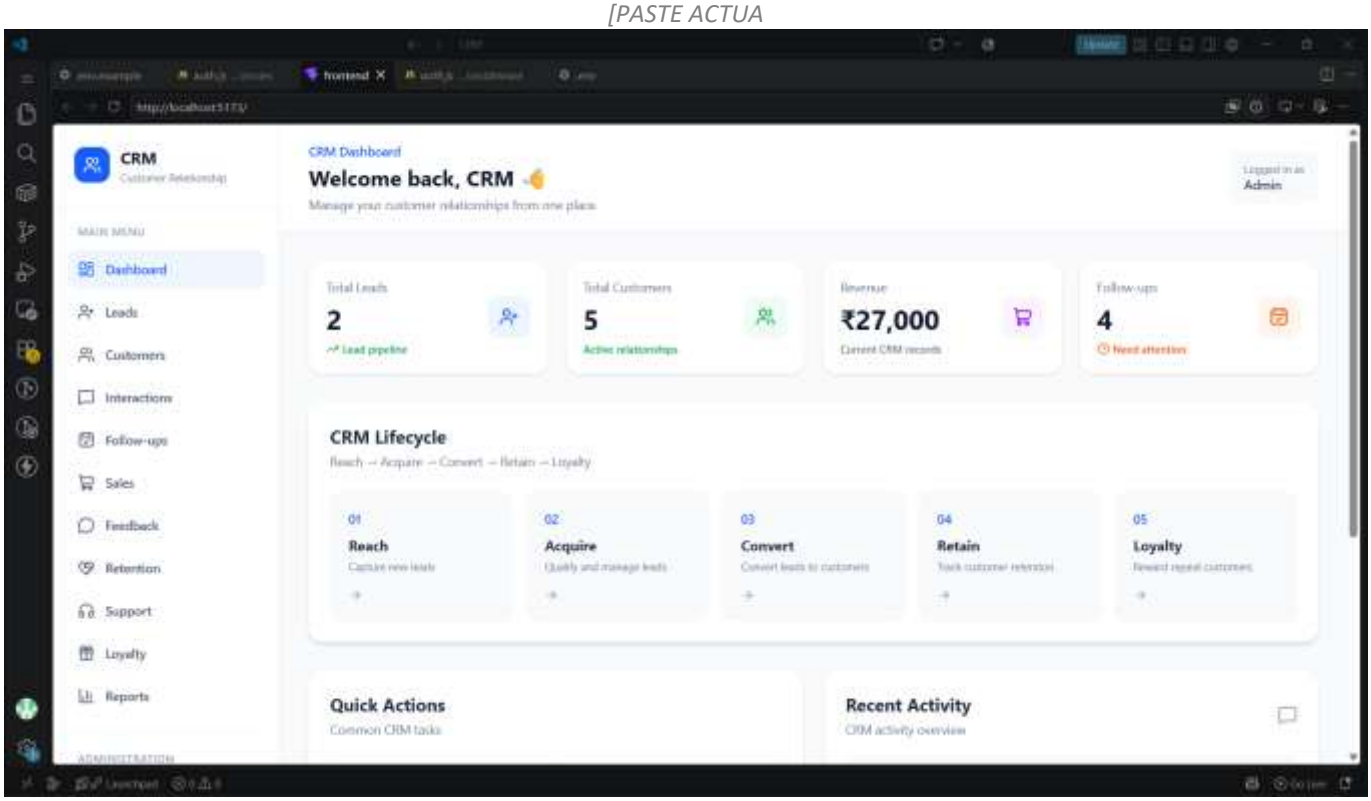

Figure 2 – Admin Dashboard

Show the Admin dashboard after successful login.

[PASTE ACTUA

L SCREENSHOT HERE]

Figure 3 – User and Role Management

Show the Admin user-management screen or staff role details.

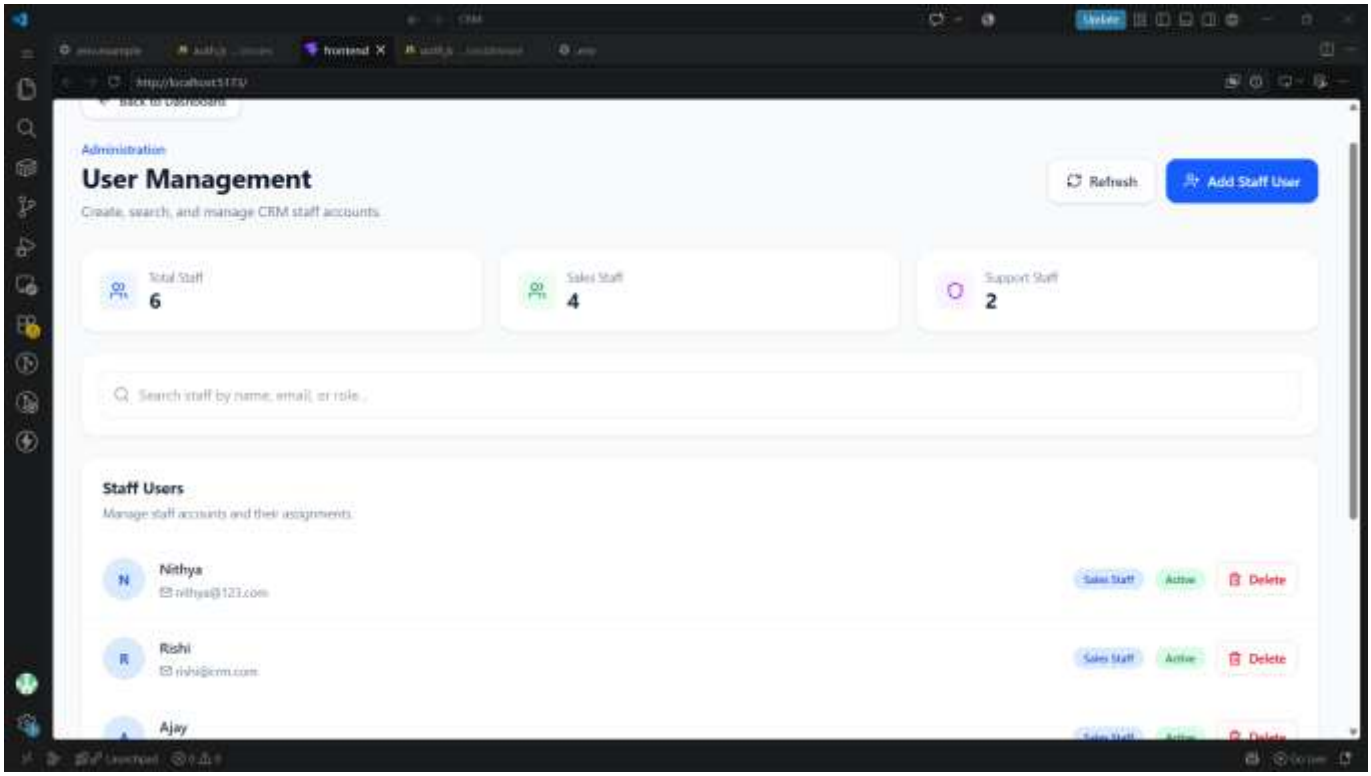

Figure 4 – Sales Staff Workflow

Show Sales Staff logged in and viewing permitted/assigned customer records.

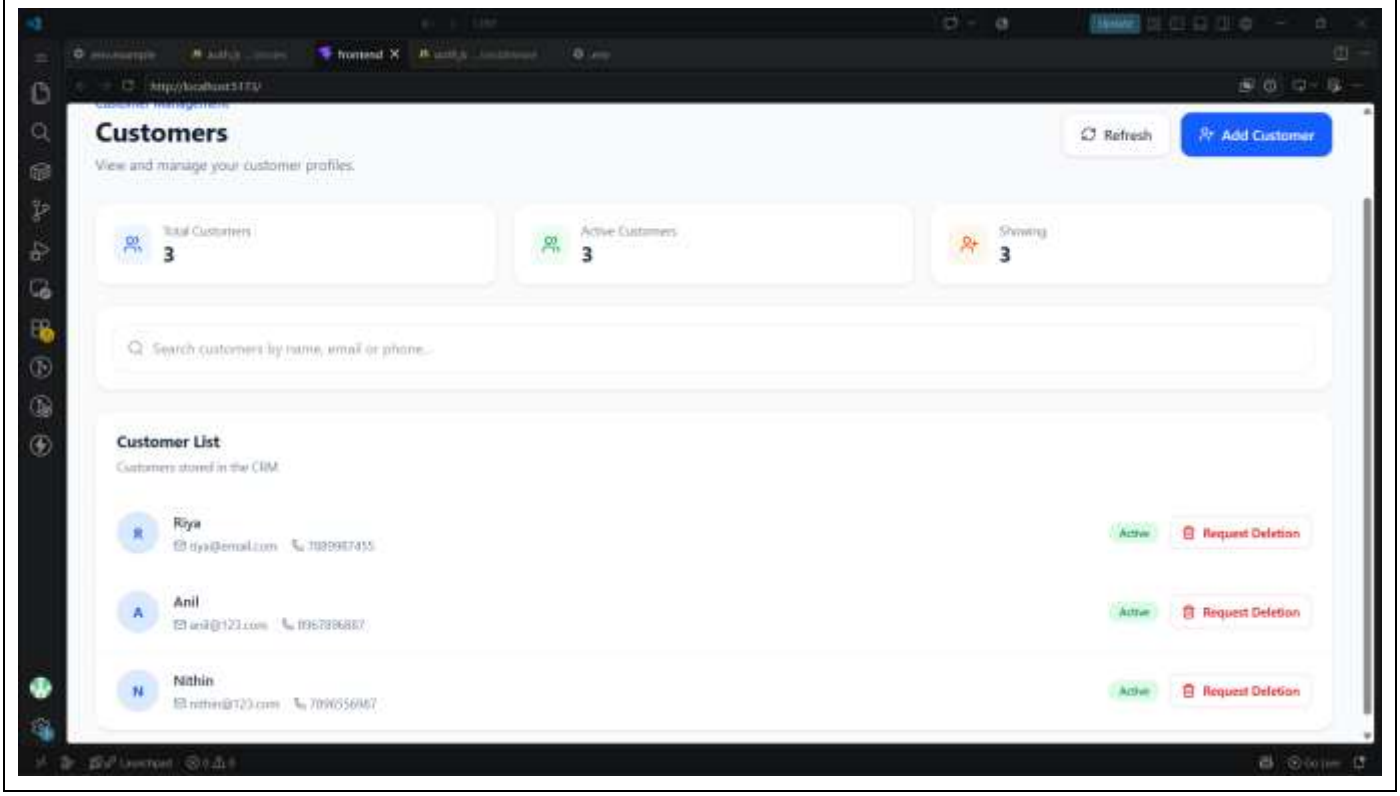

Figure 5 – Support Staff Workflow

Show Support Staff logged in and the permitted support interface.

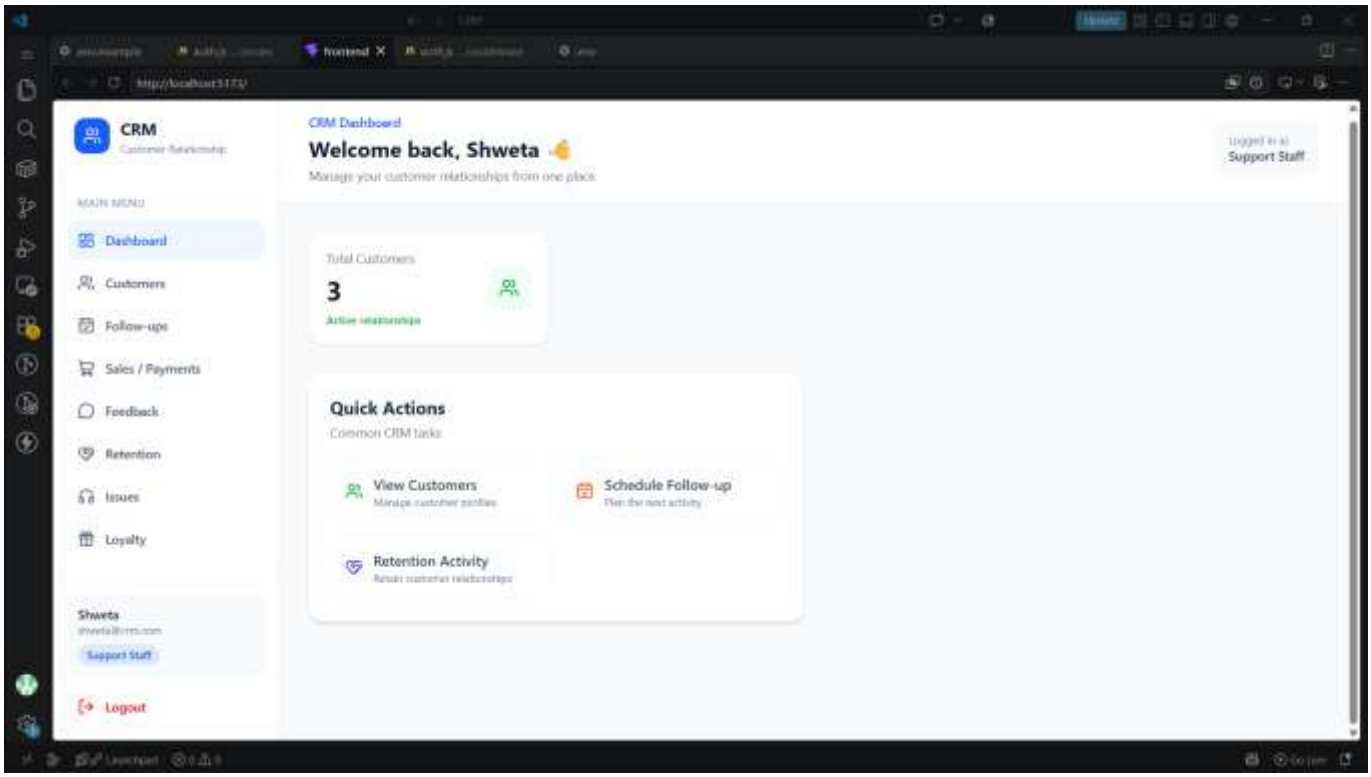

Figure 6 – Customer and Lead Workflow

Show a saved customer and a lead record in the CRM.

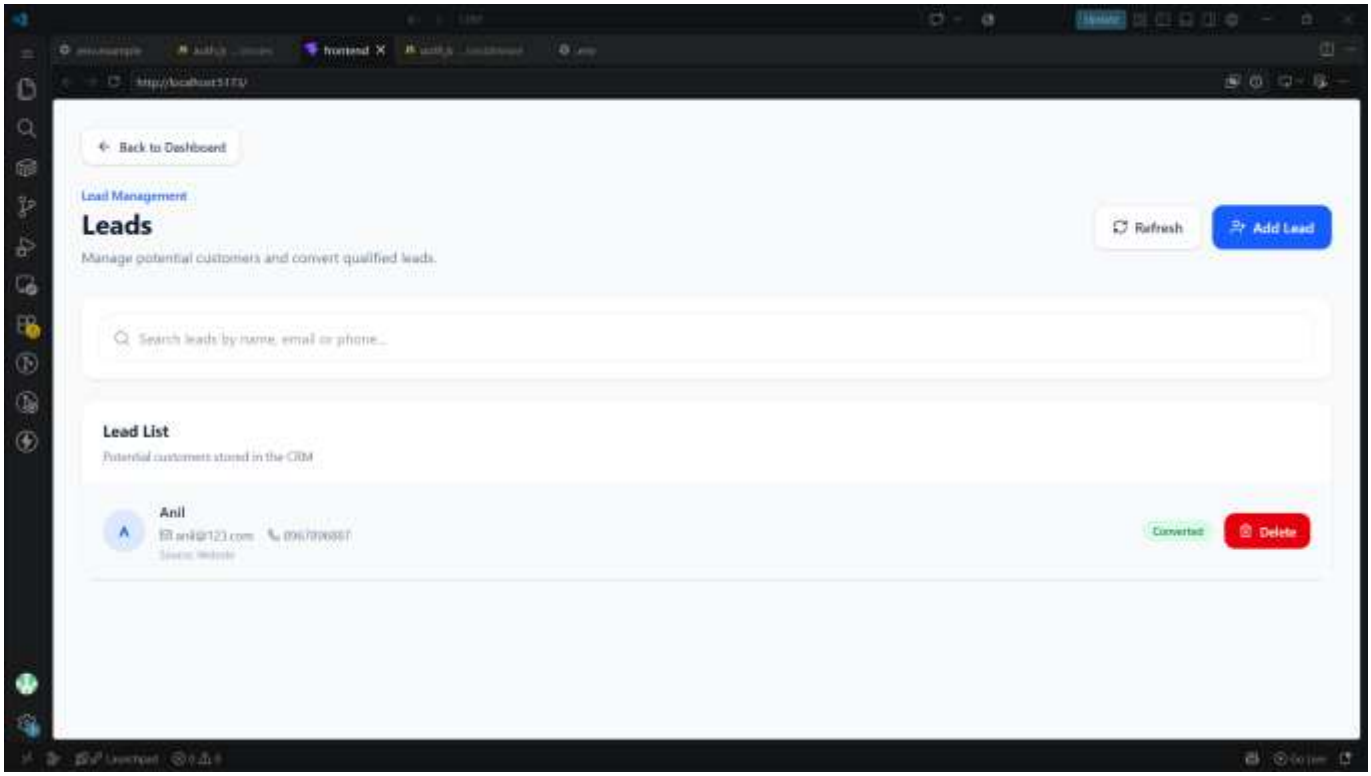

Figure 7 – Deletion Request Workflow

Show the staff deletion request and the Admin review/status, if implemented.

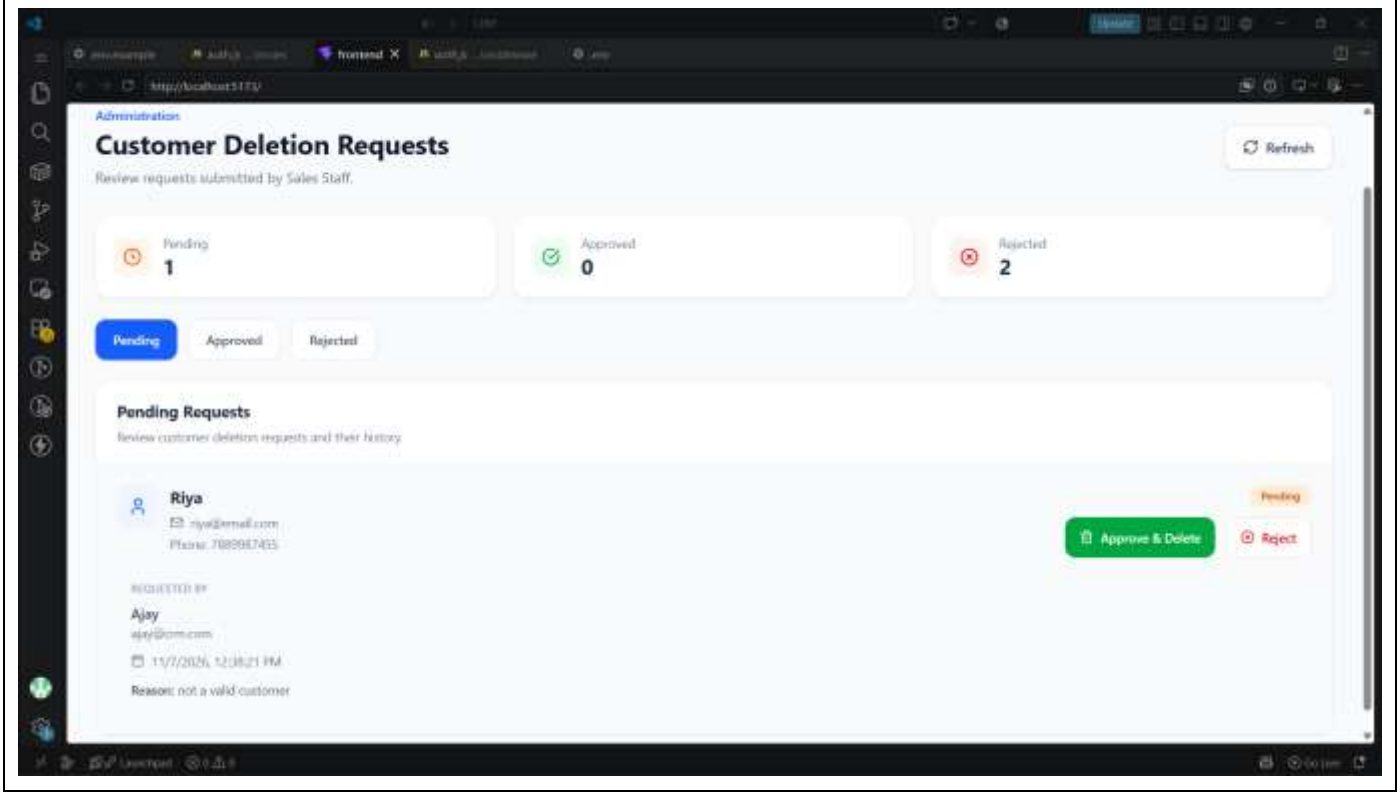

Figure 8 – Audit Log Verification

Show MongoDB Compass auditlogs with a recent LOGIN or other activity record.

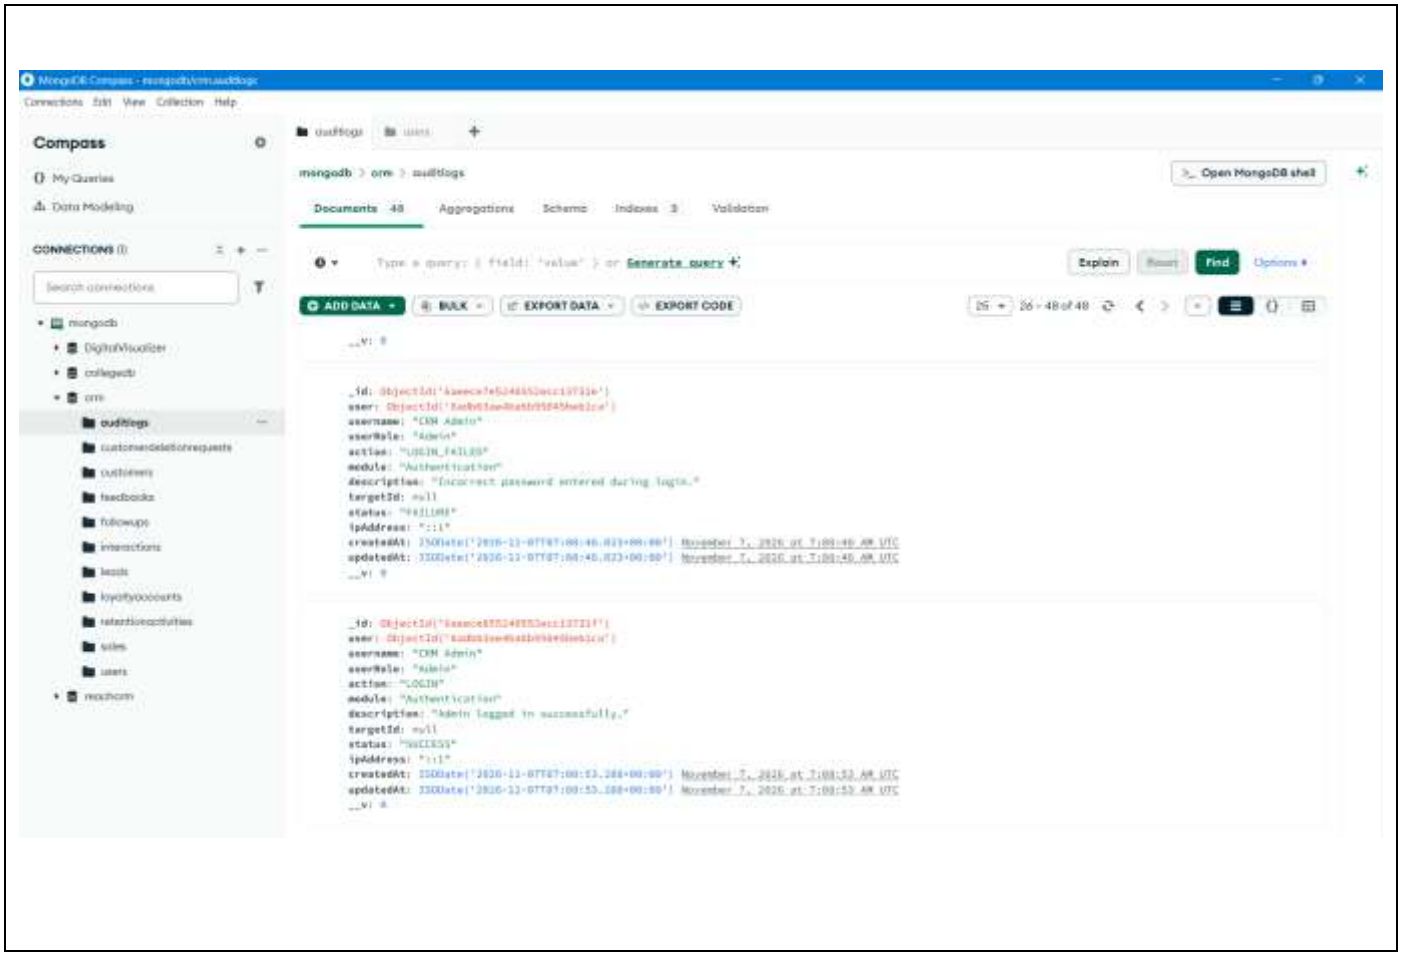

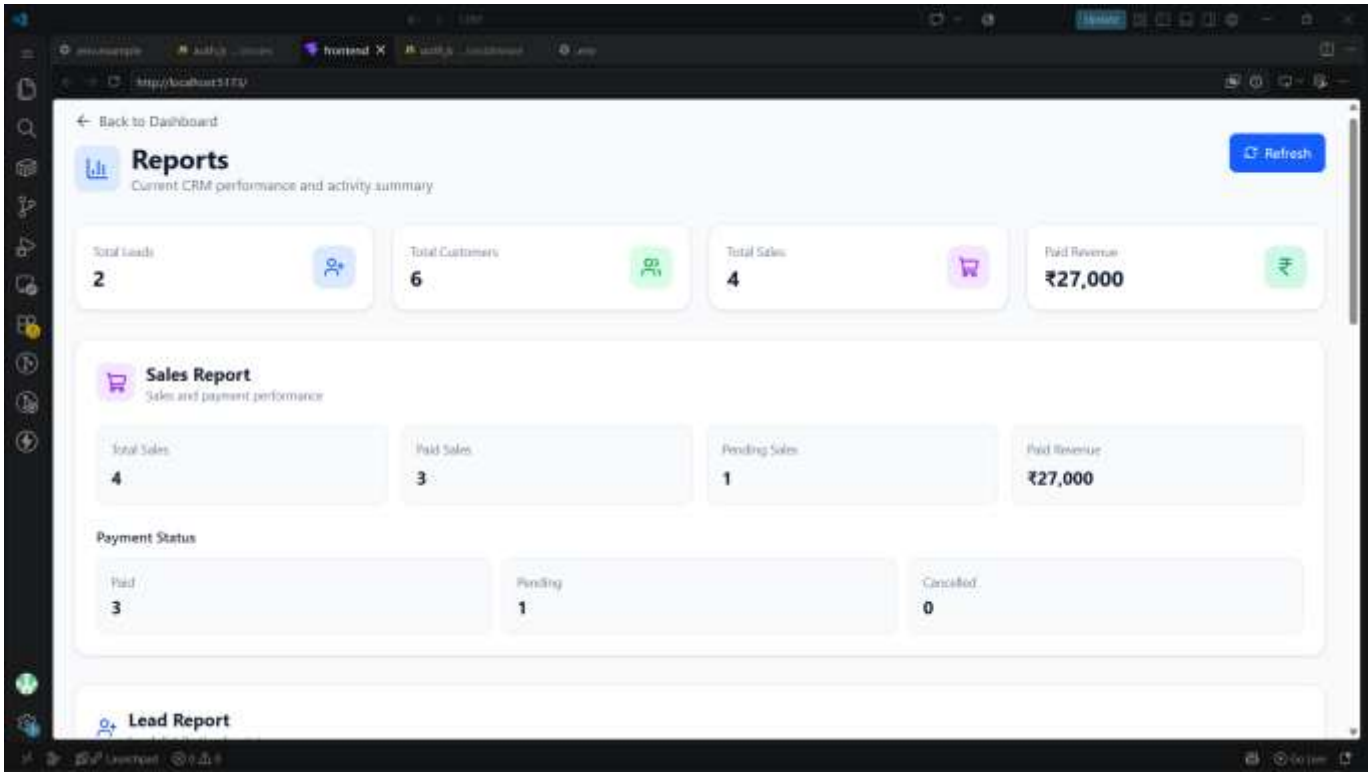

Figure 9 – Reports / Dashboard Validation

Show a CRM report or dashboard summary based on stored data.

7. Conclusion

System validation verifies that the CRM modules work together across complete user workflows and role-based access paths. The final validation outcome should be reported using the actual execution results and screenshot evidence. Any failed or blocked scenarios should be resolved or documented before the system is considered ready.
